

# Supplementary Material for

## TraceCore: A Streaming Coreness Index over NetFlow for Time-Travel Forensics and Intrusion Detection

Wei Wu      Yuan Liu      Hui Lu      Fan Zhang      Zhihong Tian

This document supplements the main submission. To keep the main paper within the page limit, several result tables were moved here, together with a worked index example and the complete 40-run experiment ledger to which every result-table number in the paper traces. All values are reproduced verbatim from the same experiment runs as the main paper; no number changes between the paper and this supplement.

### 1 Worked Index Example (Three Epochs)

Suppose hosts  $\{a, b, c\}$  have coreness  $(1, 1, 2)$  at epoch  $t$ :  $S_{t,1} = \{a, b\}$ ,  $S_{t,2} = \{c\}$ . At  $t+1$ ,  $b$  rises to 2: **CoreDelta** appends  $(t+1, b, 1, 2)$ ; **HostTimeline** $[b]$  appends  $(t+1, 2)$ ; the epoch close materializes  $S_{t+1,1} = \{a\}$  and  $S_{t+1,2} = \{b, c\}$ . At  $t+2$  with no changes,  $S_{t+2,\cdot}$  carries forward identically and **CoreDelta**/**HostTimeline** receive nothing — quiet epochs cost only the carry-forward.

### 2 Additional Result Tables

Table 1: Static-snapshot detection across four NF-UQ-NIDS-v2 sub-datasets (best per-dataset score). A single undirected graph per sub-dataset, hosts scored by raw  $k$ -shell / fanout composites, no temporal data; confirms the structural signal is not specific to the temporal corpus.

| Sub-dataset           | hosts   | edges     | pos. | best score | R@1%  | R@5%  |
|-----------------------|---------|-----------|------|------------|-------|-------|
| NF-BoT-IoT-v2         | 293     | 332       | 8    | k_shell    | 1.000 | 1.000 |
| NF-CSE-CIC-IDS2018-v2 | 255,042 | 1,866,047 | 648  | k_shell    | 0.245 | 0.431 |
| NF-ToN-IoT-v2         | 29,245  | 30,789    | 31   | k_shell    | 0.774 | 0.774 |
| NF-UNSW-NB15-v2       | 42      | 150       | 4    | fanout     | 1.000 | 1.000 |

Table 2: Ablation on NF-CSE-CIC-IDS2018-v2 (18.8 M flows): the graph features carry the lift. TraceCore-only is essentially as good as TraceCore+Flow and well ahead of Flow-only on every PR-sensitive metric; subsampling training data  $5\times$  (frac 1.0 $\rightarrow$ 0.2) barely moves F1.

| Config                      | F1     | PR-AUC | R@10 <sup>-4</sup> | R@10 <sup>-3</sup> |
|-----------------------------|--------|--------|--------------------|--------------------|
| TraceCore + Flow (frac=1.0) | 0.9816 | 0.9983 | 0.9646             | 0.9680             |
| TraceCore + Flow (frac=0.2) | 0.9819 | 0.9986 | 0.9648             | 0.9674             |
| TraceCore only (frac=0.2)   | 0.9795 | 0.9981 | 0.9602             | 0.9621             |
| Flow only (frac=0.2)        | 0.9787 | 0.9791 | 0.9525             | 0.9609             |

Table 3: Streaming-build measurements on the 28-day LANL window (single CPU core). The query-load row runs a concurrent client issuing `point_coreness` queries against the partially-built index throughout the build. Epoch granularity, not core decomposition, is the cost driver.

| Config              | epochs | wall    | flows/s | epoch p50/p99 (ms) | RSS / index      |
|---------------------|--------|---------|---------|--------------------|------------------|
| $W=60$ s            | 40,120 | 4,564 s | 24.8 K  | 67.5 / 696.2       | 4.04 GB / 355 MB |
| $W=300$ s (bare)    | 8,024  | 1,884 s | 60.2 K  | (mean 235)         | — / 142 MB       |
| $W=300$ s + queries | 8,024  | 4,245 s | 26.7 K  | 546 / 1,378        | 2.14 GB / 142 MB |
| $W=900$ s           | 2,676  | 292 s   | 387.9 K | 90.7 / 533.5       | 2.25 GB / 65 MB  |

Table 4: Top-10 LightGBM feature importances on NF-CSE-CIC-IDS2018-v2 (split-gain). The four TraceCore graph features (bold) account for 61.4% of the top-10 split-gain (sum 6,988 of 11,381) and occupy the top four slots.

| Feature               | Split gain | Origin          |
|-----------------------|------------|-----------------|
| <b>src_fanout_out</b> | 2,045      | TraceCore graph |
| <b>src_fanout_in</b>  | 1,904      | TraceCore graph |
| <b>dst_fanout_in</b>  | 1,563      | TraceCore graph |
| <b>dst_fanout_out</b> | 1,476      | TraceCore graph |
| byte_ratio            | 989        | flow            |
| log_in_bytes          | 953        | flow            |
| dst_kshell            | 773        | TraceCore graph |
| TCP_FLAGS             | 670        | flow            |
| log_out_bytes         | 608        | flow            |
| src_kshell            | 400        | TraceCore graph |

Table 5: Per-attack-class recall at FP= 1% on NF-ToN-IoT-v2: TraceCore+LightGBM (structural+flow features) versus Flow-only LightGBM. The structural-feature advantage is largest on attacks involving *co-ordinated multi-host* activity (MITM, ransomware, scanning); it is smallest on volumetric attacks already captured by per-flow rate features (DDoS, DoS) and absent on **Backdoor** where both classifiers already saturate above 0.99.

| Attack class | #pos.   | TraceCore | Flow-only | $\Delta$ |
|--------------|---------|-----------|-----------|----------|
| mitm         | 1,488   | 0.986     | 0.632     | +35.4 pp |
| ransomware   | 659     | 0.991     | 0.672     | +31.9 pp |
| scanning     | 756,607 | 0.957     | 0.825     | +13.2 pp |
| injection    | 136,588 | 0.999     | 0.961     | +3.8 pp  |
| DoS          | 143,012 | 1.000     | 0.967     | +3.3 pp  |
| password     | 230,675 | 0.999     | 0.975     | +2.5 pp  |
| DDoS         | 404,881 | 0.999     | 0.976     | +2.3 pp  |
| xss          | 490,790 | 1.000     | 0.984     | +1.6 pp  |
| Backdoor     | 3,409   | 0.994     | 0.994     | +0.0 pp  |

Table 6: Split-protocol variants at fraction 0.2 (single controlled run). The transductive variant (features from the full train+test graph) matches the standard inductive row to within 0.2 pp on every metric; the host-group split holds out 20% of source hosts entirely. This is the full table for the variants summarized in the main paper.

| Dataset               | Variant              | PR-AUC | R@10 <sup>-3</sup> | ROC    | F1@0.5 |
|-----------------------|----------------------|--------|--------------------|--------|--------|
| NF-CSE-CIC-IDS2018-v2 | standard (inductive) | 0.9987 | 0.9697             | 0.9998 | 0.9820 |
|                       | transductive         | 0.9987 | 0.9698             | 0.9998 | 0.9820 |
|                       | host-group           | 0.9228 | 0.9045             | 0.9619 | 0.2553 |
| NF-ToN-IoT-v2         | standard (inductive) | 0.9985 | 0.9150             | 0.9970 | 0.9894 |
|                       | transductive         | 0.9985 | 0.9171             | 0.9970 | 0.9894 |
|                       | host-group           | 0.7103 | 0.0302             | 0.2318 | 0.0643 |
| NF-UNSW-NB15-v2       | standard (inductive) | 0.9894 | 0.8805             | 0.9996 | 0.9599 |
|                       | transductive         | 0.9892 | 0.8789             | 0.9996 | 0.9608 |
|                       | host-group           | 0.9882 | 0.8041             | 0.9994 | 0.9579 |

Table 7: TraceCore-R residual sensitivity to the role count  $K$  (24-hour residual, R@FP = 10<sup>-3</sup> on the LANL red-team corpus). The strict-FP operating point is stable across an order of magnitude in  $K$  and collapses only at  $K=64$ . The EWMA half-life is similarly insensitive: R@10<sup>-3</sup> stays in 0.738–0.768 across half-lives {6h, 1d, 4d}.

| $K$                | 4     | 8     | 12    | 16    | 24    | 32    | 64    |
|--------------------|-------|-------|-------|-------|-------|-------|-------|
| R@10 <sup>-3</sup> | 0.768 | 0.768 | 0.787 | 0.768 | 0.756 | 0.756 | 0.579 |

### 3 Complete Experiment Ledger

Every result-table number in the main paper and in this supplement traces to one run `tag` in Table 8. The parsed per-run metrics and the derived-evidence file accompany this supplement; full per-run manifests and raw logs are part of the artifact release at publication.

Table 8: Complete experiment ledger: all 40 runs behind the results in the main paper and this supplement. Every result-table number traces to one `tag` below; the parsed per-run metrics and the derived-evidence file accompany this supplement, and full per-run manifests and raw logs are part of the artifact release at publication.

| #  | Run tag                                  | Category | Status    | Note                                                                                                                                     |
